How To Make Dry Ice

Published: November 20, 2026 | Index ID: #-

Understanding Dry Ice and Its Common Uses

Dry ice is the solid form of carbon dioxide (CO ,), a compound that is naturally present in the Earth's atmosphere. Unlike regular water ice, dry ice does not melt into a liquid. Instead, it undergoes a process called sublimation, turning directly from a solid into a gas at temperatures of -78.5°C (-109.3°F). This unique property makes it incredibly useful for a variety of applications, from preserving frozen foods during shipping to creating dramatic fog effects for stage productions and Halloween displays. Many people also use it for cleaning delicate machinery through dry ice blasting or for carbonating beverages at home. Understanding how to make dry ice safely and effectively can open up a world of practical and creative possibilities, but it is crucial to approach the process with the proper knowledge and respect for the hazards involved.

Is It Possible to Make Dry Ice at Home?

The simple answer is yes, you can make dry ice at home, but it is not as straightforward as freezing water in your kitchen freezer. Dry ice cannot be made in a standard home freezer because the temperature required to freeze carbon dioxide is far below what consumer appliances can achieve. Instead, producing dry ice requires specialized equipment and a source of pressurized liquid or gaseous carbon dioxide. The most common method involves using a carbon dioxide fire extinguisher or a tank of compressed CO , gas. While it is possible to make small quantities at home, it is important to understand that the process involves handling extremely cold materials and pressurized gas, which can be dangerous without proper precautions.

What You Need to Know Before You Start

Before attempting to make dry ice, you must educate yourself about the risks. Dry ice is so cold that it can cause severe frostbite or cryogenic burns upon contact with skin. Additionally, as it sublimates, it releases large volumes of carbon dioxide gas, which can displace oxygen in an enclosed space and lead to suffocation. Never handle dry ice with bare hands, and always work in a well-ventilated area. It is also essential to wear protective gear, including insulated gloves and safety goggles. Furthermore, be aware that not all CO , sources are safe for making dry ice that comes into contact with food. If you plan to use the dry ice for cooling food or beverages, ensure that your CO , supply is food-grade and free from contaminants.

The Two Primary Methods for Making Dry Ice

There are two main approaches to making dry ice at home or in a small workshop. The first method uses a carbon dioxide fire extinguisher, which is relatively accessible but requires careful handling. The second method involves using a compressed CO , gas cylinder and a specialized dry ice maker or homemade apparatus. Both methods rely on the same principle: rapidly releasing pressurized CO , gas to allow it to expand and cool, forming solid snow-like crystals that can then be compressed into blocks or pellets.

Method 1: Using a Carbon Dioxide Fire Extinguisher

This is the most common method for hobbyists because CO , fire extinguishers are relatively easy to obtain. However, it is critical to use only an extinguisher that contains pure carbon dioxide and not other chemicals. Look

for a BC or ABC rated extinguisher that specifically lists CO , as the extinguishing agent. Before you begin, ensure the extinguisher is full and has not been used previously, as partially discharged extinguishers may not produce solid dry ice.

Step-by-Step Instructions:

1. Gather your materials: You will need a CO , fire extinguisher, a heavy-duty canvas bag or a thick cotton pillowcase, a pair of insulated cryogenic gloves, safety goggles, and a well-ventilated outdoor space.
2. Secure the bag: Place the discharge hose of the extinguisher inside the bag. Hold the bag tightly around the hose to create a seal. It is best to have an assistant help you hold the bag in place while you operate the extinguisher.
3. Discharge the extinguisher: Squeeze the lever of the extinguisher to release the CO ,. The gas will immediately expand and cool, forming a fluffy, snow-like solid inside the bag. Continue discharging for about 10 to 20 seconds, or until you have collected a sufficient amount of dry ice snow.
4. Allow excess gas to escape: After discharging, carefully release the bag from the hose. Some gas will continue to escape as the dry ice settles. Wait a few moments for the initial puff of gas to dissipate.
5. Compress the snow: Using your gloved hands, carefully gather the dry ice snow into a compact shape. You can pack it into a mold, such as a small plastic container or a block form, to create a solid block. Press firmly to remove any trapped gas and increase the density.
6. Store properly: Store your newly made dry ice in an insulated cooler with the lid slightly ajar to allow gas to escape. Do not seal it in an airtight container, as pressure buildup can cause an explosion.

Method 2: Using a Compressed CO , Cylinder and Dry Ice Maker

If you have access to a compressed CO , gas cylinder, often used for welding or carbonating beverages, you can produce larger quantities of dry ice more efficiently. A dry ice maker, also known as a dry ice press or block press, is a device designed specifically for this purpose. These devices can be purchased online or constructed from plans available on the internet.

Step-by-Step Instructions:

1. Set up your equipment: You will need a compressed CO , cylinder with a siphon tube (which draws liquid CO , from the bottom of the tank), a dry ice maker, and appropriate hoses and fittings. Ensure all connections are secure and leak-free.
2. Attach the tank to the dry ice maker: Connect the hose from the CO , tank to the inlet valve of the dry ice maker. Most dry ice makers have a trigger mechanism or a valve that controls the flow of gas.
3. Open the tank valve slowly: Slowly open the main valve on the CO , tank to allow liquid CO , to flow into the dry ice maker. You may hear a hissing sound as the gas expands and cools.
4. Collect the dry ice snow: As the liquid CO , enters the chamber of the dry ice maker, it will rapidly expand and cool, forming dry ice snow. Continue filling until the chamber is full.
5. Compress the snow into a block: Most dry ice makers have a press mechanism, such as a handle or a screw press, that allows you to compress the snow into a solid block. Apply steady, firm pressure to compress the snow fully.
6. Remove the block: Once compressed, open the dry ice maker and carefully remove the solid block of dry ice using your gloved hands. Transfer it immediately to an insulated storage container.

How to Store Dry Ice Safely and Effectively

Proper storage is essential to maximize the lifespan of your dry ice and to ensure safety. Dry ice sublimates at a rate of about 5 to 10 pounds per day, depending on the insulation and the size of the block. The best storage

container is a thick-walled styrofoam cooler or an insulated plastic cooler. Keep the cooler's lid slightly loose or open a crack to allow the sublimating CO_2 gas to escape. Never store dry ice in a completely airtight container, as the pressure from the expanding gas can cause the container to rupture or explode. Additionally, always store dry ice in a well-ventilated area, never in a basement, car trunk, or small room where CO_2 levels could build up dangerously.

Safety Precautions You Must Follow

Working with dry ice requires a strong commitment to safety. The extreme cold and the risk of asphyxiation are serious hazards that should not be underestimated. Here is a list of essential safety measures to follow whenever you make or handle dry ice:

- Never touch dry ice with bare skin. Always wear insulated gloves, such as cryogenic gloves or thick winter gloves made of leather or rubber. Frostbite can occur within seconds of contact.
- Wear safety goggles. Dry ice can occasionally shatter or crack, sending small particles flying. Protect your eyes from potential injury.
- Work in a well-ventilated area. Carbon dioxide is heavier than air and can accumulate in low-lying spaces. Work outdoors or in a space with excellent airflow.
- Do not ingest dry ice. Swallowing dry ice can cause severe internal injuries, including perforation of the digestive tract. Never add dry ice directly to beverages that you will drink; only use it to cool the container from the outside.
- Never store dry ice in a sealed container. As mentioned, the pressure buildup can cause explosions. Always allow gas to escape.
- Keep away from children and pets. Dry ice is not a toy and should be treated with the same caution as any hazardous material.

Creative and Practical Uses for Your Homemade Dry Ice

Once you have successfully made dry ice, you can use it for a wide range of projects. Here are some popular applications:

- Special effects fog: Place a small piece of dry ice in a bowl of hot water to create a dramatic, low-lying fog effect. This is perfect for Halloween decorations, theater productions, or photography backdrops.
- Food preservation: Dry ice is excellent for keeping frozen foods cold during long trips or power outages. Wrap the dry ice in paper or cloth and place it in the cooler with your food. It will keep items frozen far longer than regular ice.
- Carbonating beverages: A small piece of food-grade dry ice can be added to water or juice to create a fizzy, carbonated drink. Be sure to allow the dry ice to sublimate completely before consuming, and never drink the liquid while solid dry ice remains in the glass.
- Cleaning with dry ice blasting: While more advanced, some hobbyists use dry ice pellets for blasting away grime, paint, or rust from hard surfaces. This requires specialized equipment but is an effective and non-abrasive cleaning method.
- Science experiments: Dry ice is a fantastic tool for educational demonstrations. You can show sublimation, create bubbling potions with dish soap, or make a dry ice bubble bomb (safely, in a controlled environment).

Where to Buy Dry Ice If You Prefer Not to Make It

While making dry ice at home is rewarding, it may not be practical for everyone. If you need dry ice for a specific event or project, purchasing it from a commercial supplier is often easier and safer. Many grocery stores, ice cream

shops, and welding supply stores sell dry ice. You can also find it at some big-box retailers, particularly around Halloween. When buying dry ice, bring an insulated cooler and ask the staff to handle the product with appropriate gloves. Transport the dry ice in a well-ventilated vehicle, and never leave it in a closed car for an extended period.

Common Mistakes to Avoid When Making Dry Ice

Beginners often make a few common errors when attempting to make dry ice. Being aware of these can save you time, money, and potential injury. One frequent mistake is using a CO , extinguisher that has been used before or that contains a different extinguishing agent, which can result in poor quality dry ice or chemical contamination. Another error is not compressing the dry ice snow sufficiently, leading to a crumbly product that sublimates too quickly. Finally, many people fail to account for the sublimation rate and end up with less dry ice than they need for their project. Always plan to use your dry ice within 24 to 48 hours of production for the best results.

The Environmental Aspect of Dry Ice

Dry ice is considered an environmentally friendly cooling agent in many contexts. Unlike traditional refrigerants that can deplete the ozone layer or contribute to global warming, carbon dioxide is a naturally occurring gas. When dry ice sublimates, it simply returns to the atmosphere as CO ,. However, it is important to note that producing CO , gas can have an environmental footprint, particularly if it is sourced as a byproduct of industrial processes. For small-scale home use, the environmental impact is minimal, but it is worth considering the source of your CO , and using dry ice responsibly.

Conclusion

Learning how to make dry ice at home is a fascinating and practical skill that can enhance everything from party decorations to food storage. Whether you choose to use a CO , fire extinguisher
