How To Put In A Tampon

Published: November 20, 2026 | Index ID: #-

Understanding the Basics of Tampon Use for Beginners

If you are reading this, you likely have questions about how to put in a tampon for the first time. This is a completely normal part of growing up, and millions of people use tampons every month with comfort and confidence. Learning how to insert a tampon correctly can make your period experience much more manageable, allowing you to swim, exercise, and go about your daily routine without worry. This guide will walk you through everything you need to know, from selecting the right absorbency to mastering proper insertion technique. Whether you are a teenager just starting your period journey or an adult trying tampons for the first time, you will find clear, step-by-step instructions here. Let us begin this journey together with patience and practical advice.

What You Need to Know Before You Start

Choosing the Right Tampon Absorbency

Before learning how to put in a tampon, it is essential to understand absorbency levels. Tampons come in different sizes designed for different flow levels. Most brands offer regular, super, and super plus options. For beginners, starting with a regular or even a slender or light absorbency tampon is often recommended. These smaller sizes are easier to insert and more comfortable for first-time users. If your flow is heavy, you can gradually move up to a larger size once you feel more confident with the insertion process. Using a tampon with higher absorbency than necessary can lead to discomfort and increased risk of vaginal dryness, so always choose the lowest absorbency that meets your needs.

Anatomy and Positioning

Understanding your body a little better can make insertion much easier. The vagina is a muscular canal that angles slightly toward your lower back when you are standing upright. This natural angle is important to remember when inserting a tampon. You are not pushing straight up; rather, you are aiming slightly backward toward your tailbone. The vagina also has sensitive nerve endings, but the upper portion where the tampon sits has fewer nerve endings, meaning you should not feel it once it is correctly positioned. If you feel the tampon, it is likely not inserted far enough.

When to Use a Tampon

Tampons are designed for menstrual flow, so they work best when your period has started. Inserting a tampon when you are not on your period can be uncomfortable and is not recommended. The natural lubrication provided by menstrual blood makes insertion smoother and easier. If you are trying for the first time and finding it difficult, waiting until your flow is medium to heavy can make a significant difference. Some beginners find that the second or third day of their period, when flow is typically heavier, is the easiest time to practice.

Step-by-Step Guide: How To Put In A Tampon

Step 1: Wash Your Hands Thoroughly

Before touching a tampon or your vaginal area, wash your hands with soap and warm water. This simple step helps prevent introducing bacteria into your body, reducing the risk of infection. Clean hands are the foundation of safe

tampon use.

Step 2: Find a Comfortable Position

Getting into the right position is one of the most important aspects of how to put in a tampon successfully. Many beginners find it easiest to start while sitting on the toilet. You can also try standing with one foot elevated on the edge of the bathtub or toilet seat. Another common position is lying down on your back with your knees bent. The goal is to relax your pelvic muscles and have good access to your vaginal opening. Try different positions to see what feels most natural for you. Remember that relaxation is key, as tension makes insertion more difficult.

Step 3: Inspect the Tampon and Applicator

Take a moment to look at the tampon you are about to use. If you are using an applicator tampon, you will notice a larger outer tube and a smaller inner tube. The string should be visible at the base of the tampon inside the applicator. Gently pull on the string to ensure it is securely attached. The tip of the applicator may be rounded or have a gentle curve. Some applicators have a grip area in the middle to help you hold it steady. Familiarizing yourself with the tampon before insertion can make the process feel less intimidating.

Step 4: Position the Applicator

Hold the applicator between your thumb and middle finger at the grip area, which is usually the textured or ridged section in the middle of the outer tube. Your index finger should be free to push the inner tube later. The tip of the applicator should be pointing toward your vaginal opening at a slight angle. Remember that you are aiming toward your lower back, not straight up. This angled approach follows the natural direction of your vaginal canal.

Step 5: Insert the Applicator Gently

With your other hand, gently separate the labia or folds of skin around your vaginal opening. This step is especially helpful for beginners because it provides a clearer opening. Place the tip of the applicator at the vaginal opening and gently insert the outer tube into your vagina. Insert it only as far as where your fingers touch your body, meaning the grip area should be at the opening of your vagina. The outer tube should be fully inserted, but do not force it. If you encounter resistance, relax, breathe deeply, and try again slowly. The tampon should slide in smoothly when you are relaxed and properly positioned.

Step 6: Push the Inner Tube

Once the outer tube is in place, use your index finger to push the inner tube all the way into the outer tube. This action pushes the tampon out of the applicator and into your vagina. You will feel the inner tube click or stop when it is fully inserted. The outer tube should now be empty, and the tampon string will be between your body and the applicator. Carefully remove both parts of the applicator together, leaving only the string hanging outside your body. The string should be visible and accessible for later removal.

Step 7: Ensure Proper Placement

After removing the applicator, check that the tampon feels comfortable. If you can feel it, it is probably not inserted far enough. You can gently push it further with your finger, or simply remove it and try again with a fresh tampon. A correctly placed tampon should be unnoticeable once inserted. The string should hang outside your body. If the string accidentally gets pushed inside, you can gently retrieve it with clean fingers, but if it is too far in, you may need to remove the tampon and start over.

Common Challenges and How to Overcome Them

Difficulty Inserting the Tampon

Many people struggle with insertion during their first few attempts. This is entirely normal. If you are having trouble, consider using a small amount of water-based lubricant on the applicator tip to help it slide more easily. Avoid using petroleum jelly or lotions, as these can cause irritation or interact with the tampon material. Another helpful tip is to try inserting the tampon after a warm shower or bath when your muscles are naturally more relaxed. Deep breathing exercises can also help release tension in your pelvic floor muscles.

Pain or Discomfort During Insertion

Insertion should never be painful. If you experience sharp pain, stop immediately. Pain may indicate that you are not relaxed, using the wrong angle, or forcing the tampon in the wrong direction. Take a break, reposition yourself, and try again. If pain persists, it is advisable to consult a healthcare provider, as there may be an underlying issue such as a vaginal infection or a condition like vaginismus, which causes involuntary muscle tightening.

The Tampon Feels Uncomfortable After Insertion

If you feel the tampon after insertion, it is usually because it is not deep enough. The vagina has few nerve endings in its upper portion, so a correctly placed tampon should not be felt. Simply remove the tampon and try again with a fresh one, inserting it a little further. If the tampon feels like it is poking or rubbing, it may also be positioned too shallowly or at the wrong angle. Practice makes perfect, and with time, you will develop a better sense of what proper placement feels like.

Tampon Removal: A Simple Process

Knowing how to put in a tampon is only half the story; safe removal is equally important. Tampons should be changed every four to eight hours, depending on your flow. To remove a tampon, wash your hands first. Sit on the toilet or stand in a comfortable position. Relax your muscles, reach between your legs, and locate the string. Gently pull the string downward and forward at the same angle you used for insertion. The tampon should slide out easily. If you feel resistance, it may be because the tampon is not fully saturated, which can cause minor friction. If this happens, wait a few minutes or until your flow increases before trying again. Never pull sharply or forcefully.

Safety Tips and Best Practices for Tampon Use

Change Tampons Regularly

One of the most important rules of tampon use is to change them regularly. Leaving a tampon in for longer than eight hours increases the risk of toxic shock syndrome, a rare but serious bacterial infection. Set a reminder on your phone if necessary, especially at night. Some people prefer using a pad overnight to avoid the worry of sleeping through a tampon change, but if you choose to use a tampon overnight, set an alarm to change it when you wake up.

Always Use the Lowest Absorbency

Using a tampon with higher absorbency than needed can cause vaginal dryness and increase the risk of micro-tears during removal. Choose the absorbency that matches your flow for each day of your period. On lighter days, switch to a light or regular absorbency tampon. On heavier days, you may need super or super plus. Listening to your body and adjusting accordingly is key to comfortable tampon use.

Know the Signs of Toxic Shock Syndrome

While toxic shock syndrome is rare, it is important to recognize the symptoms. These include sudden high fever, low blood pressure, vomiting, diarrhea, a sunburn-like rash, and muscle aches. If you experience any of these symptoms while using tampons, remove the tampon immediately and seek medical attention. Educating yourself

about this condition ensures you can use tampons with confidence and awareness.

Frequently Asked Questions About Tampon Insertion

Can a tampon get lost inside me?

No, a tampon cannot get lost inside your body. The cervix, which is the opening to the uterus, is too small for a tampon to pass through. The tampon remains in your vaginal canal, and the string is designed to hang outside your body for easy removal. If you cannot find the string, try squatting or bearing down gently as if having a bowel movement, which may bring the tampon closer to the opening. If you still cannot locate it, a healthcare provider can help remove it easily.

Is it normal to struggle with insertion at first?

Yes, it is completely normal to find insertion challenging at first. Many people need several attempts before they feel comfortable with the process. The key is patience, relaxation, and practice. Your body will become more familiar with the sensation, and your muscles will learn to relax with each attempt. Do not be discouraged if it does not work perfectly on your first try.

Can I use a tampon if I have never had sex?

Absolutely. Tampon use is not related to sexual activity. The hymen is a thin membrane with openings that can stretch to accommodate a tampon. Using a tampon does not affect your virginity or sexual health. Many young people who have never had sex use tampons regularly without any issues.

Should I use an applicator or non-applicator tampon?

This is a matter of personal preference. Applicator tampons are often easier for beginners because the applicator guides the tampon into place, reducing direct contact with the vagina. Non-applicator tampons are more compact and produce less waste but require you to insert the tampon directly with your finger. Many people start with applicator tampons and later switch to non-applicator ones once they are comfortable with the process.

Conclusion

Learning how to put in a tampon is a valuable skill that can make managing your period more convenient and comfortable. With the right preparation, a relaxed mindset, and a little practice, you will soon be able to insert a tampon quickly and confidently. Remember to choose the correct absorbency, find a comfortable position, angle the applicator toward your lower back, and always prioritize hygiene by washing your hands before and after. Be patient with yourself during the learning process,
